2024	97.46	0.05	45.33	52.12

Basic drinking water access in the Dominican Republic increased steadily from 2000 to 2024, with year-over-year gains slowing as national coverage approached universal access.

While basic drinking water access in the Dominican Republic has become more available in the last 25 years, safely managed access remains consistently lower and the gap between basic and safely managed access has persisted and slightly widened over time, indicating ongoing challenges related to water quality, reliability, and treatment.
